Despite 50mm of rain in the previous four days, the gorge was immediately fossilized and only in the second half had minimal flow due to several close resurgences. In the final rappel the flow was again absent. In the first 5-6 jumps with patchy ice it was necessary to anchor in the trees and minimal rigging is needed to avoid problem in case of flow. After this fossil phase the arms are sufficient (at the limit some to be doubled). In the final rappel, it would be good to make a split on the left bank after 10 meters from the current limb (backward, but still not problematic in retrieving ropes and chafing). Park at elevation 835 on a clearing on the left instead of getting to the park at 920. Take CAI851 trail that in less than an hour gets to elevation 1200 beginning descent. On the right of the park835 clearing is the dirt road that takes you to the Brentaz cadin in 10 minutes. (machine translated)
