Paese: Italia / Italy Regione: Friuli Venezia Giulia Sottoregione: Udine Città: Sappada		
Difficoltà: non così difficile	Grado: v3 a2 III	Tempo totale: 3h45
Tempo avvicinamento: 55min	Tempo giaro: 2h30	Tempo ritorno: 20min
Altitudine di entrata: 1550m	Altitudine di uscita: 1200m	Altitudine delta: 350m
Lunghezza del canyon: m	Rapel più alto: 25m	Quantità rapelli:
Transporto: a piedi	Tipo di roccia:	Area di ingresso: km ²
Stagione:	Orientamento:	Tempo migliore:
Valutazione: ★ 2.9 (4)	Info: ★ 2.3 (4)	Belay: ★ 1 (4)
Specialità:		
Attrezzatura:		
Sintesi: (traduzione alternativa) Open and incised canyons alternate. Caution: slippery! The first two abseiling sections can cause the biggest problems in strong currents.		
Idrologia:		
Accesso: (traduzione alternativa) On the SR355 to Sappada. On the west side of the bridge over the Rio del Mulino (right bank), a road branches off down to the Piave. At the T-junction, turn right for another 150m to a reasonable parking lot next to the Piave river.		
Avvicinamento: (traduzione alternativa) At the parking lot, cross the Piave bridge and follow trail 316 up through the forest. Later, the path runs along the rock face to a junction. Follow the right-hand path down to the stream (317). Entry at the small wooden bridge.		

Giro: (traduzione alternativa)

The initially open canyon cuts in more and more and increasingly becomes a real canyon. If you can't find the belay in the lower third (where the gorge is darkest), look far to the right to spot the lone anchor.

1. 8m R (right)
2. 15m R (two pools to go)
3. 8m R, old but stable anchor (still two bolts)
4. 10m L, natural anchor with ropes
5. 15m L 2 points(!), possible dry variation on the right with very long traverse (looks scary)
6. 3m R, natural anchor and ropes under a boulder, well hidden
7. 12m R
8. 5m obligatory slide (an aid point should be added here)
9. 10m R
10. 5m L
11. 13m L
12. 5m R
13. 4m R (also NA on a tree, but looks unreliable)
14. 6m R
15. 15m R
16. 5m R (anchor and nut)
17. 25m R behind a boulder, another possibility is 10m back (2 points)
18. 15m L, do not go all the way to the stream, but exit 2m before to the left, otherwise you have to climb over a rather slippery boulder to the next anchor
19. 15m L
20. 6m R
21. 10m R
22. 20m R
23. 15m R

Ritorno: (traduzione alternativa)

Either follow the streambed directly back to the parking lot or take the yellow-marked path down to the orographic left (crosses to the orographic right about 2 minutes before the parking lot - here are the water level pictures from the descriptions).

Sceso oggi con flusso medio sui 30-40l (Giovedì 23 erano scesi 35mm di pioggia) per poi crescere dopo alcune piccole confluenze dalla sx arrivano alla fine sui 50-60l. Armi adeguati per questo flusso, ma da migliorare. Abbiamo stretto un dado su una placchetta che girava per 90°. La calata da 15 in sx subito dopo la calatona da 30 necessita di uscire dal flusso e non scendere nella pozza sotto il masso, ma fermarsi sul massone da dove si trova l'armo successivo, sempre in riva sx. Occhio pure al recupero corda poiché sotto al massone c'è un tronco insidioso per incastro corda. A quota 1430 sul greto si può sforrare in entrambe le rive. Se si sale a dx si raggiunge il sentiero d'avvicinamento. Foto 1: la prima calata dove si capisce subito se il flusso è ok per la discesa Foto 2: corridoi nella prima metà Foto 3: flusso al check point

We did some construction works where it was really necessary. Now the canyon can be safely done, but the anchors are still single-points, and sometimes rusty. Taking spare maillons and maybe a bolting kit seem to be a good idea. (The full upgrade would require 20-22 additional bolts.) Here is what we found: 1. 8m R (right) 2. 15m R (two pools to go) 3. 8m R, old but stable piton (two pools to go) 4. 10m L, natural anchor with ropes 5. 15m L 2 points(!), possible dry option on the right with very long traverse (looks scary) 6. 3m R, natural anchor and rope under a boulder, well hidden 7. 12m R 8. 5m obligatory slide (aid point should be added here) 9. 10m R 10. 5m L 11. 13m L 12. 5m R 13. 4m R (also NA on a tree but looks unreliable) 14. 6m R 15. 15m R 16. 5m R (piton and nut) 17. 25m R behind a boulder, another option is 10m back (2 points) 18. 15m L, don't go till the stream but exit to the left 2m before, otherwise you have to climb up a rather slippery boulder to the next anchor 19. 15m L 20. 6m R 21. 10m R 22. 20m R 23. 15m R Narrow all the way, not recommended in high water. There are several improvised exit possibilities in the first part (none verified but look possible).

Beautiful canyon, very slippery! Anchorages really in bad condition. Many rapid links are missing. But we were able to walk the canyon without drilling. Water level after 3 days of light rain (4-8mm) was fun/dangerous. (traduzione alternativa)

2024-06-04 | Montie | |📖| ★★ | |📍| ★ | |🌊| Alto | |👍| Completato

The description of the canyon makes you think that you should go in during high water levels, which I do not agree with. I suppose the description was written in the fall or in a dry summer, because on June 4th (and 3 days after a lot of rain) the water level during our descent (see pictures and video) would be what I would consider the maximum level with the current anchor situation. The anchor situation is currently bad - very bad! We had to place nuts and pitons on some rappels (unfortunately only brought a hand drill, did not want to spend too much time drilling). Next person to descend this canyon: please take a drill and a good amount of bolts :) The anchors are currently placed so that you have to take the most intense route straight through the water, which at higher water levels is uncomfortable or dangerous. This can easily be avoided with better anchor placement. Check the water level before you go (follow the path parallel to the Rio Siera the reach the point of the picture).
